INSURANCE

CYBERSECURITY AWARENESS MONTH

Five cybersecurity fundamentals every organization should revisit

Strong cyber readiness is built through practical controls that protect people, data and essential operations.

01 **Protect critical accounts with MFA**

Prioritize email, payroll, financial portals, remote access and administrator accounts. Use strong authentication methods and monitor exceptions.

02 **Make security everyone's responsibility**

Train employees to spot suspicious messages, verify payment requests and report concerns quickly. Refresh training as threats change.

03 **Keep software and devices current**

Maintain an inventory, prioritize critical patches, and include remote devices and less-visible applications in update plans.

04 **Limit access to what each role needs**

Review permissions regularly, promptly remove access when roles change and protect privileged accounts with MFA.

05 **Back up data—and test recovery**

Protect essential data with separate backups, restricted administrative access and regular restoration tests.

Turn fundamentals into consistent practice.
